

HMRC REST API – Creating a test application

To create an application, either for test or for access to the live APIs, you must register or sign in on the developer page : <https://developer.service.hmrc.gov.uk/api-documentation>

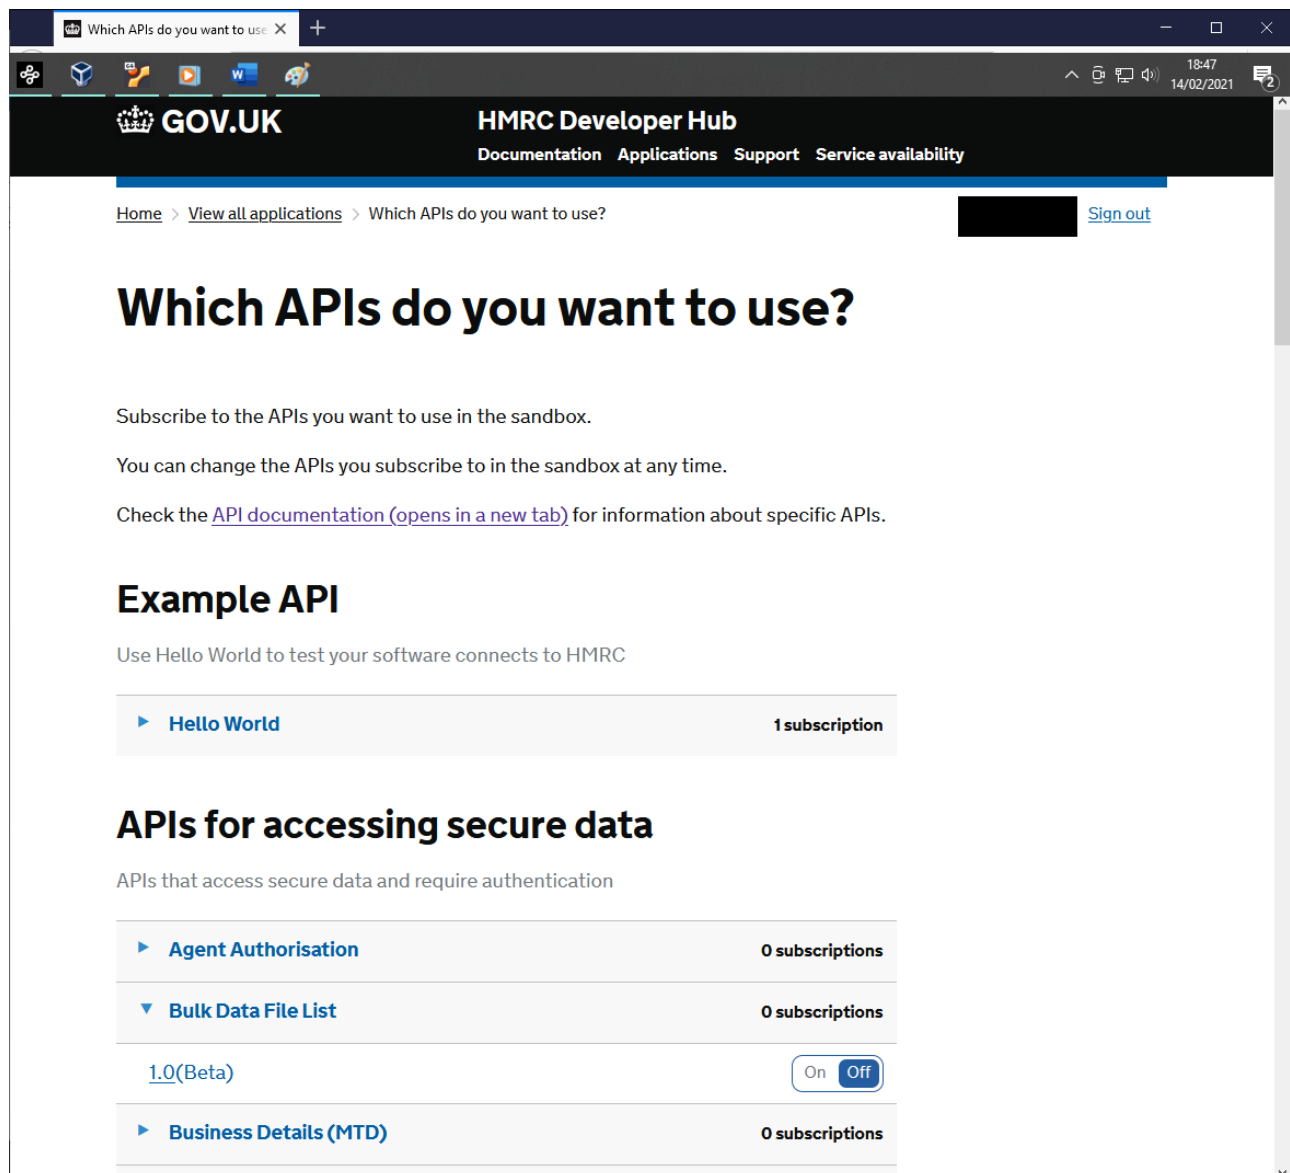

This will take you to your account page.

Clicking on an application name will take you to the Application Details page, otherwise, pick **Add an application to the Sandbox** and click **Continue**.

Enter the name for the application and click **Continue**. The name will be checked and may be rejected if the format is wrong. For example, it does not allow HMRC in the name and this is not case sensitive.

Which goes to :

The screenshot shows the 'Which APIs do you want to use?' page on the HMRC Developer Hub. The page has a dark header with the GOV.UK logo and navigation links: Documentation, Applications, Support, and Service availability. Below the header, there's a breadcrumb trail: Home > View all applications > Which APIs do you want to use? and a 'Sign out' link. The main heading is 'Which APIs do you want to use?'. Below this, there's explanatory text: 'Subscribe to the APIs you want to use in the sandbox. You can change the APIs you subscribe to in the sandbox at any time. Check the [API documentation \(opens in a new tab\)](#) for information about specific APIs.' The 'Example API' section shows 'Hello World' with '1 subscription'. The 'APIs for accessing secure data' section lists 'Agent Authorisation' (0 subscriptions), 'Bulk Data File List' (0 subscriptions), and 'Business Details (MTD)' (0 subscriptions). The 'Bulk Data File List' entry has a version '1.0(Beta)' and an 'On/Off' toggle switch.

API Name	Subscriptions
▶ Hello World	1 subscription
▶ Agent Authorisation	0 subscriptions
▼ Bulk Data File List	0 subscriptions
1.0(Beta)	On/Off
▶ Business Details (MTD)	0 subscriptions

Where you subscribe the application to any APIs which you require to test. It is quite a long list and is not restricted to MTD APIs. Pick all that are necessary, although it is possible to return to this page at a later date to change subscriptions. Just to be really helpful, not all MTD APIs are suffixed with (MTD), although some are.

Click the API name on the left, which will open a new line below with an On/Off button. Just click On to activate.

Some APIs offer 2 current versions, each of which can be selected separately.

▼ Individual Employment		1 subscription
1.2(Beta)	☐ On ☐ Off	
1.1(Beta)	☐ On ☐ Off	

The Applications details page looked like this: From here it should be possible to access all relevant pages and settings.

Application name	
Application description	None
Privacy policy URL	None
Terms and conditions URL	None

Next pick **Credentials**, which will tell you that the credentials are the Client Id and Secret. Click **Continue** to see the Client ID and then **Continue** again, followed by **Generate a client secret**.

Save these, as they are needed in the authorisation process. Both pages off a copy button, which will copy the value to the clipboard ready for pasting. Pay particular attention to these lines on the Client Secret page.

We only show you a new client secret once to help keep your data secure.
Copy the client secret immediately.

Also note that it is suggested that Client Secrets are rotated, for security reasons and that the client id can be associated with up to 5 secrets at any time.

Copy the client secret immediately.

Client secrets		Created	Last used
[REDACTED]	Copy	14 Feb 2021	Not used

Rotate your client secret regularly

Rotate your application's client secret to shorten the period an access key is active, reducing the impact to your business if it is compromised.

To rotate your client secret:

1. Generate a new client secret, in addition to the one used by your application
2. Update your application to use the new client secret
3. Check that your application is working with the new client secret
4. Delete the inactive client secret

You can have up to 5 client secrets at any time.

[Generate another client secret](#)

[View your application details](#)

From this page, pick **View your application details**, which may require you to login in again. It was necessary to login 4 times just to get through the process end to end, when writing this guide. Logging in should take you back to the Applications details page.

Next pick **Redirect URIs** and add at least one callback url to be used in the authorisation process. If unsure about what is acceptable, check the **Must be a valid redirect URI** link. More than one is allowed and all will be displayed. Click **Continue** when necessary.

Next is IP Allow list, which in theory holds a list of fixed IP addresses from which calls are allowed. Note the line that says fixed IPs. This optional.

IP allow list

Application:**Environment:** Sandbox

An IP allow list is a security feature that lets you control which IP addresses are allowed to make API requests to HMRC.

The IP allow list is optional and is only suitable if you have a static set of IP addresses where your software is hosted.

If you have dynamic IP addresses, consider switching to static IP addresses to use the IP allow list.

The IP allow list limits access to HMRC services to approved IP addresses associated with your application.

Before you start

You will need:

- one or more static IP addresses

Continue

The Team members page lets administrators add other registered users to access the app.
